WHEN TECHNOLOGY STRIKES HARD!

Life is full of unfortunate occasions as much as losing all the project data before the deadline or being a victim of natural catastrophe… We all have to look at things from a wider point of view that everything bad is good for something but I just do not know for what yet.

Ecology goes in a hand with everything; it is our will to change what some of us had done. If there was no human damage to the Mother Nature, no one of us would have to naturally come up with ecology. It is our way to pay back to the nature what we have done to her, and thank for what we are getting.

My first ecological steps happened when I was very little and I took my actions as grounded. Separating rubbish, cleaning after myself or just cleaning after others without asking for something back, knowing we are getting many things back from the Earth, Mother Nature was just part of my family education, what we all are trying to promote as the biggest step in Ecology, the awareness of the people.

Energy efficiency is a contemporary issue that is very important to educate about but as you start teaching kid how to read, you should first teach him or her the letters of the alphabet. Bragging around with empty words such solar panels or passive systems looks nice, but nobody has any profit from it except looking professional while not. This big topic, "energy efficiency" should be first well introduced step by step from basic rules to let the common population understand the consequences and certain outcomes. Then we can do a real change, as some say, "education is the key".
